

Project X - Investigation/Sampling Scope of Work

The Scope of Work includes:

- Installing three approximately 40-foot deep soil borings to attempt reconnaissance groundwater sampling using temporary wells. Field screen soil samples, but no soil sample analyses.
- Analyze three reconnaissance groundwater samples for NWTPH-Dx and diethylene glycol monobutyl ether (chemical found in oven cleaner regulated under MTCA).
- Prepare a basic letter report that includes a description of the field activities performed, a brief discussion of the results, a site map showing the boring locations, analytical data summarized in a table and boring logs. Note that the analytical costs is a place holder for now. We are not yet sure the cost for analysis of the glycol/ether compound (waiting for a lab quote).
- A discussion with Ecology regarding the findings.
- Transport and disposal of investigation derived wastes.
